Discontinuation of Soft Core in Standard Offering

In 2006, Mohawk introduced a light weight alternative to standard particle core – Soft Core. This product was/is a viable solution to reduce the weight of a solid core door while avoiding some of the performance issues seen in hollow core doors. Relatively speaking, standard particle core doors have a density of 28 – 32 lbs. while the soft core has a density of approximately 14 lbs.

Due to the lack of volume requirements for this offering, Mohawk has removed it from our standard product offering, and will supply only under special circumstances (and minimum quantities) as required for contract work.

Please consult the Mohawk factory for more details.
